

Meteor Mayhem Playtesting and Balance Questions

Card Distribution

All cards currently have similar counts. I did not calculate exact probabilities for this prototype; these notes record what I watched for during playtesting.

Questions

- How often should high-impact cards appear? Often. The game felt more exciting when the state could change quickly, but I would keep testing where excitement turns into frustration.
- How likely is a player to obtain each mining tier? It takes time to build a strong mining tier, and opponents have several ways to slow that progress.
- Are there multiple viable paths to winning? Players can pursue multiple strategies, although fast mining progression appeared strongest in the tests so far.
- Does one strategy become dominant across repeated games? Building the mining tier as quickly as possible appeared to be the preferred strategy. That became a specific focus for later playtests.
- How much control do players have over uncertainty? Players have several ways to draw specific cards and scout for high-tier resources, giving them options for responding to uncertainty.
